

# Agentic AI

AI agent → "AI ~~user~~ systems that can do work for you independently"

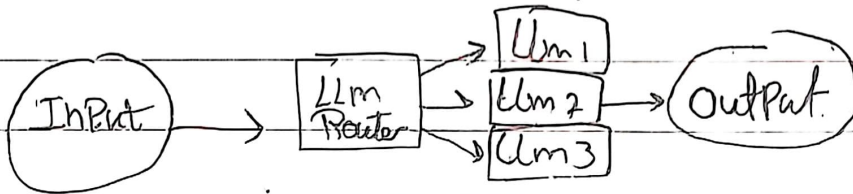

- in the early 2025 new definition was introduced "AI Systems where an LLM controls the workflow"
- Later at 2025 "An LLM with tools in a loop to achieve goal"

## Agentic AI Design Patterns

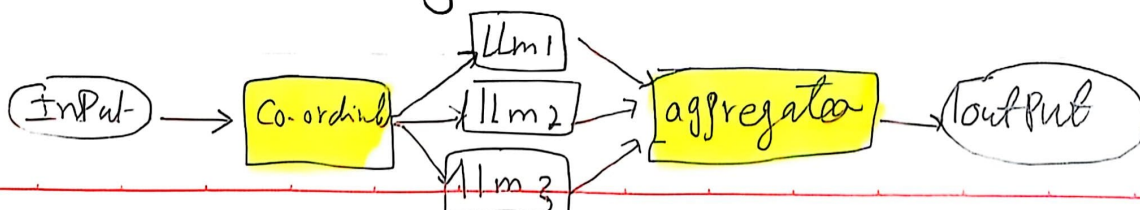

① Prompt Chaining: decompose into fixed sub-tasks

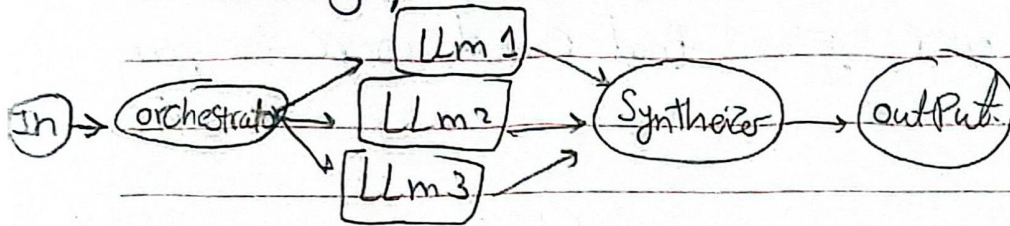

② Routing: use LLM to take input & decide which LLM we should use to answer this problem

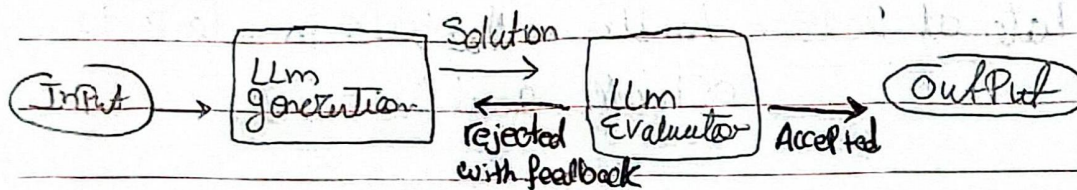

③ Parallelization: Breaking down tasks & running multiple subtasks concurrently

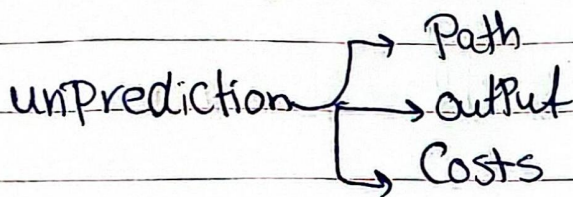

④ orchestrator workers complex tasks are broken down dynamically & combined

⑤ Evaluator - Optimizer

Risks of Agent work flows:

to solve the "unPrediction" we can use:

monitor (observe, evals)

guardrails (ensure the LLM agent behave safely & consistently + it's within our boundaries)
